ABSTRACT OF THE DISCLOSURE

A mask for skin diving includes a skirt and two lenses laterally symmetrically mounted within the skirt. The skirt has two outer ends that are rearward inclined by a predetermined angle, and the lenses also have two outer ends that are rearward inclined by an angle corresponding to the skirt, so that a user's sight projecting toward two lateral sides could be widened without being blocked by the skirt. The angle by which the outer ends of the skirt and the lenses are rearward inclined is preferably within the range from 5 to 10 degrees.
